

4º Passo - Instalar Certificado

A instalação do certificado de servidor está dependente do tipo de software a que se destina.

Para facilitar este processo e para apoiar os utilizadores a DigiCert inclui junto do certificado um ficheiro de texto com instruções específicas e ajustadas ao software de destino.

INSTALL_INSTRUCTIONS.en.txt

Installation Instructions for Apache
=====

To correctly install your certificate, it is important to
configure the server to use the intermediate DigiCertCA.crt
file in addition to eduroam_pt.crt.

Our online Apache installation guide is available here:

https://www.digicert.com/ssl-certificate-installation-apache.htm

A typical Apache installation will involve configuration lines
like these in your <VirtualHost *:443> block:

SSLCertificateFile /your/path/to/eduroam_pt.crt
SSLCertificateKeyFile /your/path/to/eduroam_pt.key
SSLCertificateChainFile /your/path/to/DigiCertCA.crt

(The eduroam_pt.key file refers to the private key which only you
control. It was likely generated in the same place where your
CSR was created on the day this certificate was ordered.)

After installing your certificate, you can verify that it is
correctly installed by using our Certificate Testing tool:

https://www.digicert.com/help/index.htm

If you are having difficulty installing your certificate, please
contact our friendly support team for more assistance.
